### INSTALACIÓN Y MANTENCIÓN

La superficie sobre la cual se instalan las baldosas puede ser sobre radier o sobre ripio compactado.

El pegamento que normalmente se usa para instalar las baldosas es Mortero.

Previamente a la intalación, a la baldosa debe aplicarse con brocha una lechada o empaste (agua con cemento ) en la parte posterior de la baldosa. Esto es importante porque ayuda a que el empaste hace que la baldosa se adhiera al mortero sin tener una película de polvo seco que hace que se suelte.

La separación entre baldosas debe ser de dos milímetros mínimo.

Una vez instalada la baldosa se debe esperar 24 hrs antes de aplicar el frague.

Después de 72 hrs aproximadamente de fraguada la baldosa, ya está en condiciones de pulirla.

El pulido se realiza con máquina pulidora y a mano, consiste en pasar piedras de esmeril de carburo de silicio, de granulometría 120. También se puede pasar lija al agua, fina para no rayar las baldosas.

La esencia de este proceso es para retirar los restos de frague, emparejar posibles imperfecciones de la instalación y dejar suaves las baldosas para que la mantención del piso sea fácil.

Una vez pulidas las baldosas, el tipo de mantención dependerá de la terminación querida.

Opaco: La baldosa por su esencia es opaca ( cemento pigmentado), puede trapearlas con detergentes de piso diluidos en agua, nunca aplicarlos de manera directa ya que puede manchar la baldosa, el trapo empapararlo reiteradamente en la lavasa preparada, esto ayuda a retirar el polvo y limpia el piso.

Brillante:Después de pulir la baldosa puede aplicar cera, incolora; en el mercado existe una gran variedad de ceras para baldosas puede ser en crema, en pasta o líquida; lo importante es que antes de aplicar la cera debe limpiar el piso y retirar el polvo para que no se acumule y manche la baldosa.

Semibrillo: Existe en el mercado un sello para pisos cementicios, se aplica con brocha, lo importante de este producto independiente de la marca debe dejar que se seque antes de pisarlo, igual que la cera autobrillante, la mantención posterior puede ser trapeado. El sellado puede ser aplicado dos veces al año.

**NUNCA APLIQUE ÁCIDO NI CLORO PURO EN BALDOSAS AL LÍQUIDO.**
